

6. Glossary of Terms

Unless specified otherwise in the text, the following terms and phrases are defined as follows.

Accretion flows The local inflows to the Cedar River, including tributary and

> subsurface inflows, downstream of Landsburg Diversion Dam, at which point most of the City's instream flow

commitments will be measured.

Adaptive As applied in the HCP, the process of adaptive management management

is defined with three basic elements: (i) an initial operational decision or project design made in the face of uncertainty about the impacts of the action; (ii) monitoring and research

to determine impacts of actions, and (iii) changes to

operations or project design in response to new information.

Adfluvial A fish population or stock that rears as adults in a lake and

spawns in a river or tributary of a river.

Alevin A recently hatched, juvenile salmonid that has not emerged

from the gravel and that still has its yolk sac.

Alluvial soils Soils deposited by running water.

Alpine Fir Forest -50-70 percent crown closure in "alpine" species; other species

mixed

Pure

present either coniferous or deciduous.

Alpine Fir Forest -More than 75 percent crown closure in Abies species (Pacific

silver fir, noble, or subalpine fir) or mountain hemlock or

lodgepole pine.

Anadromous fish Those species of fish, such as salmon, that hatch and typically

> rear in freshwater, migrate to the ocean to mature into adults, and return upstream to freshwater rivers, streams, and lakes to

spawn.

Applicant Non-federal landowner who has submitted an application for

> an Incidental Take permit in accordance with Endangered Species Act. In the case of the Cedar River Municipal Watershed Habitat Conservation Plan, the Applicant is the

City of Seattle.

Aquatic habitat Bodies of water such as rivers, streams, lakes, and wetlands,

as defined below.

Bank armoring Hardening of streambanks to reduce erosion potential using

hard (rocks or structures) or soft (biotechnical) engineering

techniques.

Basal area The cross-sectional area of a single tree or of all the trees in a

> stand measured at breast height, or 4.5 ft above ground. This is usually expressed in square ft per acre and is measured

outside the bark.

Bedload Substrate that is too heavy to stay suspended in water and is

transported along the bottom of the stream by bouncing,

rolling, or sliding.

Best Management

Methods, measures, or practices designed to reduce adverse Practices (BMPs)

impacts, usually applied as a system of practices rather than a

single practice.

Biodiversity Biological diversity; the ensemble and the interactions of the

natural genetic, the species, and the ecological diversity in a

given place at a given time.

Biodiversity

An integrated series of management actions designed for **Pathways** sutainable, joint production of commodities and ecological

goods and services (from viable populations of wildlife to

carbon sequestration.)

Biological legacies Features of a previous forest that are retained at timber

harvest or left after natural disturbances, including large old-

growth or other snags, stumps, live trees, logs, soil

communities, hardwood trees, and shrubs.

Blowdown Trees felled by high wind.

A hydrologically isolated, low nutrient wetland that receives Bog

> its water from precipitation only. Bogs typically have no inflow and rarely have outflows, and have specially adapted vegetation such as sphagnum moss, Labrador tea, bog laurel, sundews, and some sedges. Bogs may have an overstory of spruce, hemlock, cedar, or other tree species, and may be

associated with open water bodies.

6-2 Glossary May 1999

Adult fish used for breeding in a hatchery. **Broodstock**

Buffer A forested strip left or treated differently during timber

> harvest to protect sensitive ecosystems (e.g., streams, wetlands, and old growth) or fish or wildlife habitat. Management activities such as planting or thinning may be allowed in buffers if they are consistent with the conservation

objectives for the buffer.

Candidate species, Any species being considered by the Secretary of the Interior federal

or the Secretary of Commerce for listing as a threatened or endangered species under the Endangered Species Act, as

amended, but not yet the subject of a proposed rule.

Candidate species, Wildlife species that is under review by Washington Department of Fish and Wildlife for possible listing as

endangered, threatened, or sensitive when sufficient evidence

suggests that its status may meet criteria defined for endangered, threatened, or sensitive in WAC 232-12-297. Candidate species are designated in WDFW Policy POL-

M6001

Canopy The cover of branches and foliage formed collectively by the

> crowns of trees or other growth. Also used to describe layers of vegetation or foliage below the top layer of foliage in a forest, as when referring to the multi-layered canopies or multi-storied conditions typical of ecological old-growth

forests.

Canopy closure The degree to which the boles, branches, and foliage (canopy)

> blocks penetration of sunlight to the forest floor or obscures the sky; determined from measurements of density (percent

closure) taken directly under the canopy.

Carabid (beetle) Predaceous ground beetles from the family Carabidae, a large

family of beetles. Many feed on pest species.

Carrying capacity The maximum number of organisms that can be sustained in a

given area of habitat.

A large-scale, high intensity natural or human-caused

disturbance that occurs infrequently, such as insect or disease outbreaks, extraordinary flooding, or severe fire, that would require action to protect drinking water quality, protect public safety, and prevent significant damage to natural resources.

The removal of trees for sale from an area or areas of forest

Catastrophic

that experienced a catastrophic event.

EA/Final EIS Glossary

salvage

Catastrophic event

state

Cavity tree A tree or snag with holes or openings caused by fire, rot, limb

or breakage, or excavated by birds. Such trees are for roosting, reproduction, and foraging by birds and mammals.

Cedar River Basin The entire area that drains into the Cedar River above Lake

Washington.

Cedar River Municipal Watershed The Cedar River Municipal Watershed, an administrative unit of land; the 90,546-acre municipal watershed within the upper part of the Cedar River Basin, upstream from the City's water intake at Landsburg Diversion Dam. It is comprised of eight major subbasins and 27 subbasins, 26 of which drain into the Cedar River. It supplies about 2/3 of the drinking water to

Seattle Public Utilities' water service area.

Char Fish in the family Salmonidae that belong to the genus

Salvelinus. For example, bull trout is a char.

City, the The City of Seattle.

Clearcut A silvicultural system and type of regeneration harvest that is

widely used in the Pacific Northwest. It involves removal of nearly all standing trees within a given harvest area. This system focuses on promoting regeneration of species which thrive in full sunlight. It is also the most efficient and economical method of harvesting timber. As defined by Forest Practices Rules (1995), "...a harvest method in which the entire stand of trees is removed in one timber harvesting

Clearcut (continued)

operation. Except as provided in WAC 222-30-110, an area remains clearcut until: It meets the minimum stocking requirements under WAC 222-34-010(2) or 222-34-020(2); and the largest trees qualifying for the minimum stocking levels have survived on the area for five growing seasons or, if not, they have reached an average height of four feet."

Coarse woody debris

Large pieces of wood in forests, including logs (down dead trees), pieces of logs, large branches, stumps, and snags (standing dead trees). Provides valuable habitat for many kinds of animals and contributes significantly to biodiversity

of conifer forests.

6-4 Glossary **May 1999**

Commercial thinning

As used in this HCP, the silvicultural practice applied on Matrix lands (those available for commercial harvest) that removes excess trees from overstocked, merchantable secondgrowth stands (usually over 30 years old), including the removal of weak, diseased, and dying trees. The primary intent of this practice is to provide revenue while maintaining or improving the growth, health, and wind-firmness of the leave trees by assuring adequate growing space and crown area, and improving stand vigor. Compared to conventional commercial thinning, the commercial thinning described in this HCP will also have the objectives of developing a high level of vertical and horizontal stand structure, accelerating development of mature stand characteristics, developing a heterogeneous understory, and recruiting large snags and down logs as coarse woody debris in older stands. These stand characteristics will be fostered by multiple thinning entries and longer (120-140 year) regeneration harvest rotations. See Figure G-1.a for illustration.

Commercial timber

harvest zone

Matrix lands; that portion of the Cedar River Watershed land base that is not a part of the Ecological Reserve from which

second-growth trees will be harvested for revenue.

Commission, the Cedar River Instream Flow Oversight Commission, to be

established as part of the HCP pursuant to the Instream Flow

Agreement.

Competitive exclusion

A phase in which the canopy closes and competition among trees becomes intense in a developing stand. Also sometimes

called stem exclusion.

Compliance monitoring

Monitoring performed to determine whether HCP programs

and elements are implemented as written.

Compliance point The location(s) in the Cedar River at which measurements are

made to assure compliance with instream flow and flow

downramping rate requirements.

Component Refers to one of the four major types of commitment in the

HCP: watershed management, anadromous fish mitigation,

instream flows, or monitoring and research.

Conifer Forest-Mixed Species Less than 50 percent of crown closure classified in any conifer species type, but coniferous species must constitute

50 percent or more of the total crown closure.

Connectivity A measure of the extent to which conditions between

> different areas of similar or related habitat provide for successful movement of fish or wildlife species, supporting

populations on a landscape level.

Conservation

strategy

A collective set of measures to avoid, minimize, or mitigate the potential take (or equivalent of take) of species addressed by the HCP, or for protecting, rehabilitating, enhancing, or

restoring habitats for these species.

Contiguous habitat Habitat that is distributed continuously or nearly continuously

across the landscape.

Critical flows The minimum instream flows (cfs) maintained in the Cedar

> River below the Landsburg Diversion Dam to protect habitat conditions for anadromous fish under very adverse and infrequent hydrologic conditions (on average, one-in-ten years). Critical instream flows are lower for most periods of the year than normal flows, which are provided, on average,

nine-in-ten years.

Critical habitat Areas designated under the federal Endangered Species Act,

> defined as "specific areas with the geographic area occupied by the species, at the time it is listed . . . on which are found those physical or biological features (I) necessary to the conservation of the species and (II) which may required

Critical habitat (continued)

special management considerations or protection; and . . . specific areas outside the geographic area occupied by the species, at the time it is listed . . . upon a determination . . . that such areas are essential for the conservation of the species."

Critical habitat unit

(CHU)

Crown closure

Units of critical habitat; see also Northern Spotted Owl CHU.

See "Canopy closure."

Crown Competition

Factor

An index of tree canopy closure. An open grown stand with crowns barely in contact with each other has a CCF of 100. At CCF 300, some stand mortality can occur (because of competition for light, water, and nutrients), but growth still

exceeds mortality.

Culmination of

Mean Annual

Increment

The point in stand development at which average growth

(production) of the stand peaks.

Cutslope An over-steepened slope face created by excavating into a

hillside, such as during road construction.

6-6 Glossary May 1999 Dead storage The water in Chester Morse Lake below a depth of 1532 ft,

which is the natural gravity outlet of the lake.

Debris flow A moving mass of rock fragments, soil, and trees, with a high

volume of water that can travel at speeds greater than 60 mph and travel long distances down steep confined mountain

channels. Typically caused by storm events.

Decommissioning Roads are left in a condition suitable to control erosion and

maintain water movement. Methods of decommissioning include removal of bridges, culverts, and fills in accordance

with WAC 222-24-050.

Dewatering (of

redds)

A condition in which water flows are decreased to a level

where redds (nests of salmonid eggs) are exposed.

Diameter at breast

height (dbh)

The diameter of a tree, including bark, measured 4.5 ft above the ground on the uphill side of the tree and measured in

inches.

Discretionary water As used in the HCP, water volumes or flows that can be

provided, at the discretion of the City, to increase instream flows for fish at different times when it is needed, typically as recommended by the Cedar River Instream Flow Oversight

Committee.

Dispersal The movement of juvenile, subadult, or adult animals from

one sub-population to another. Individuals may disperse for

foraging, breeding, and other reasons.

Distribution (of a

species)

The spatial arrangement of individuals of a species within its

range.

Disturbance Significant change in forest structure or composition through

natural events (such as fire, flood, wind, earthquake, or disease) or human-caused events (forest management).

Dog-hair stand An over-stocked, closed-canopy stand with little or no

understory vegetation because of a lack of light penetration, and where growth is suppressed. Typically less than 30 years

old, but can be older.

Douglas Fir Forest -

Mixed

50 to 70 percent crown closure in Douglas fir; other species

present either coniferous or deciduous.

Douglas Fir Forest -

Pure

More than 75 percent crown closure in Douglas fir (clearly

dominant); other species present either coniferous or

deciduous.

Downramping

Reductions in instream flows as a result of changes in water or hydroelectric facility operations, most often expressed as a rate of drop of river water elevation in inches per hour.

Early seral – grass forb stage

Very recently harvested or disturbed forest habitat characterized by dominance of grasses and other non-woody vegetation, defined in this HCP as such habitat that is 0-9 years of age.. Tree seedlings are present, but not dominant, and shrubs can be present.

Early seral – open canopy stage

Recently harvested or disturbed forest habitat dominated by young trees (saplings) and shrubs, defined in this HCP as such habitat that is 10-29 years of age. Canopy closure is typically less than 60%.

Ecological Reserve

Also Reserve. An area in the Cedar River Municipal Watershed designated for protection in the HCP, or about 64% of the land in the watershed. Included in the Reserve are all existing old-growth forest; all mapped wetlands, lakes, and ponds; streams; riparian habitat; headwall basins, sensitive soils, and inner gorges; extensive areas of second-growth conifer forest; the entire Spotted Owl Critical Habitat Unit (CHU); meadow and wetland complexes; special habitats, such as meadows and cliffs; and additional areas to provide landscape functionality and connectivity. Activities not allowed in the Reserve include harvest of existing old-growth or late-successional forest and timber harvest for commercial purposes. Activities allowed include limited restoration or ecological thinning, and restoration planting to accelerate redevelopment of old-growth conditions and/or restore riparian function.

6-8 Glossary **May 1999**

Ecological thinning

As used in this HCP, the experimental silvicultural practice applied in the Reserve of cutting, damaging, or otherwise killing some trees from some areas of older, overstocked, second-growth forest (typically over 30 years old). The intent of ecological thinning is to encourage development of the habitat structure and heterogeneity typical of latesuccessional and old-growth stands, characterized by a high level of vertical and horizontal stand structure, and to improve habitat quality for wildlife. It is expected that techniques will include variable-density thinning to created openings, develop a variety of tree diameter classes, develop understory vegetation, and recruit desired species; and creating snags and logs by uprooting trees, felling trees, topping trees, injecting trees with decay-producing fungus, and other methods. Ecological thinning does not have any commercial objectives. However, in those cases in which an excess of woody material is generated by felling trees, trees may be removed from the thinning site and may be sold or used in restoration projects on other sites. See Figure G-1.b for illustration.

Ecosystem

A natural system comprised of component organisms interacting with their environment.

Ecosystem management

A strategy or plan to provide for the needs of organisms associated with an ecosystem, typically focusing on management of habitat.

Edge habitat

An area where different ecological communities meet or where different successional stages or vegetative conditions within communities come together. Also, as used in the context of instream flows, that portion of a stream nearest to the wetted margins of the active stream channel.

Effectiveness monitoring

Monitoring to determine whether implemented HCP conservation strategies result in anticipated habitat conditions or effects on species.

Element

A feature of a component. For example, a fish ladder would be an element of the anadromous fish mitigation component.

Emergent surfaces

Those portions of objects that protrude above the surface of the water (e.g., logs). May be important for some species as an egress from the water.

Emergent vegetation

Aquatic plants that are only partially submerged, and are typically rooted in the aquatic environment with the majority of photosynthesis occurring above the surface of the water (e.g., cattails).

Endangered species, federal

A designation as defined in Section 3 of the federal Endangered Species Act for a species in danger of extinction throughout all or a significant portion of its range.

Endangered species, state

A wildlife species native to the state of Washington that is seriously threatened with extinction throughout all or a significant part of its range within the state. State endangered species are legally designated in WAC 232-12-014 and defined in WAC 232-12-297 Section 2.4.

Entrainment

To draw in and transport by the flow of a fluid. For example, some fish are likely entrained into the penstocks of the Cedar Falls Powerhouse thought the intake structure.

Environmental Assessment (EA)

A formal document prepared under the National Environmental Policy Act to assess the effects that a particular action will have on the environment.

Environmental Impact Statement (EIS)

A document prepared under the State Environmental Policy Act to systematically analyze the effects that site-specific activities will have on the environment

Escapement

The number of adult fish returning to spawn after harvest. Escapement goals are often established by fisheries managers.

Even-aged forest

A forest stand with minimal differences in age, generally less than 10 years, between trees.

Felsenmeer

Broken and fragmented rock, often in angular blocks, formed on gentle mountain slopes through weathering processes, particularly freezing and thawing.

Firm block (of water)

As part of the instream flow regime, a specified volume of water (2,500 acre feet) that the City would provide, as a commitment, between June 17 and August 4 in most normal years to supplement the required minimum instream flows in a manner that benefits anadromous fish.

Fish ladder

A structure typically used to allow passage of adult fish upstream over barriers that block their migration.

Fish screens

Screens installed on water intakes to reduce juvenile and adult fish entrainment and injury from impingement.

6-10 Glossary **May 1999**

Fish weir A fence or enclosure set in a waterway for blocking fish

passage or capturing fish.

Flow stable mode An operational mode for a hydroelectric project that

maintains stable flow downstream of the project, such that the project does not peak (fluctuate flow) with electrical load

(demand).

Forest succession The sequential change in composition, abundance, and

patterns of species that occurs as a forest matures after an event in which most of the trees are removed. The sequence of biological communities in a succession is called a sere, and

the are called seral stages.

Fry A free-swimming, juvenile salmonid that has recently

emerged from the gravel and has fully absorbed its yolk sac.

Full suspension yarding

Transport of logs to a landing without either end of the log touching the ground. Typically, this is accomplished with

cable systems or helicopters.

Geographic Information System (GIS) A computer system for collecting, storing, retrieving, transforming, displaying, and analyzing spatial or geographic data, linking areas or map features with associated attributes for a particular set of purposes, including the production of a variety of maps and analyses.

Glacial moraine

tree

As used in the HCP, a deposit of sediment at the advancing front edge of a glacier. A glacial moraine is deposited wherever a glacier pauses, marking the farthest extent of the end of the advance, and is often crescent shaped. Sediment may also be deposited laterally.

Green recruitment

As defined in WAC 222-16-010, those live trees that remain after harvest for the purpose of becoming future wildlife

reserve trees under WAC 222-30-020(11).

Green tree A living and growing tree.

Green tree retention A stand management practice in which live trees are left

within harvest units to provide habitat components (such as

spatial and structural diversity and connectivity).

Habitat The sum total of environmental conditions of a specific place

occupied by plant or animal species or a population of such species. A species may require or use more than one type of

habitat to complete its life cycle.

Habitat conservation plan (HCP) As defined under Section 10 of the federal Endangered Species Act, a plan required for issuance of an incidental take permit for a listed species. Called "conservation plans" under the Act, HCPs can address multiple species, both listed and unlisted, and can be long term. HCPs provide for the conservation of the species addressed, and provide certainty for permit applicants through an implementation agreement between the Secretary of the Interior or Secretary of Commerce and a non-federal entity.

Half-pounder

Steelhead that, during their initial ocean residence, grow to an average weight of one-half pound.

Hardwood Forest - Mixed

50 to 70 percent crown closure in deciduous species (red alder, black cottonwood, or biglear maple); other species present either coniferous or deciduous.

Hardwood Forest -Pure More than 75 percent crown closure in deciduous species (red alder, black cottonwood, or big leaf maple); other species present either coniferous or deciduous.

Harm

A form of take under the federal ESA; defined in federal regulations as an act which actually kills or injures wildlife. Such acts may include significant habitat modification or degradation where it actually kills wildlife by significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering (50 CFR 17.3).

HCP year 1

That period of time through the end of the first full calendar year following the effective date of the HCP.

Headwall

Very steep, concave portions of the headwaters of a stream, including tops of rock ledges and areas of a basin that are usually wet and unstable.

Headwaters

The source of a stream or stream system.

High-normal flows

The high part of the normal minimum instream flow curve, for flows in the Cedar River below the Landsburg Diversion Dam, during the period between October 8 and December 31 for some normal years. The applicability of this curve in any given year is based upon storage and hydrologic conditions prevailing each fall and is determined by specific flowswitching criteria and procedures. High-normal flows are intended to provide more beneficial habitat conditions for anadromous fish in the fall than low-normal flows or critical flows.

6-12 Glossary May 1999

Hydroacoustic surveys

A method for underwater assessment of fish using an echolocater (device that uses sound to locate objects).

Hydrograph

Graphical relationship of stream discharge (rate of flow)

plotted against time.

Hydrologic

Pertaining to the cycling, movement, distribution, and properties of water on the surface of the land, in the soil and underlying rocks, and in the atmosphere.

Hydrologic maturity

The state of forest vegetation whereby vegetative water usage and the effect of forest on hydrology are similar to that of unharvested forest vegetation. As defined in the HCP, hydrologically mature vegetation has a canopy closure of 70 percent or more, and a diameter (dbh) of 9 inches or more.

Implementation Agreement

A part of the application for an incidental take permit for an approved HCP, an agreement that specifies the terms and conditions, resources, schedule of activities, and expectations for the parties to the agreement.

Implementation monitoring

Compliance monitoring; monitoring to determine whether the HCP conservation strategies are implemented as written.

Incidental take

As defined by the Endangered Species Act, the taking of federally listed animal species, if the taking is incidental to, and not the purpose of, carrying out otherwise lawful activities. See also "Take."

Incidental Take Permit A permit issued by the U.S. Fish and Wildlife Service or National Marine Fisheries Service to a non-federal entity that allows the incidental take of a threatened or endangered species; requires the permittee to carry out specified actions that minimize and mitigate the impacts of the incidental take to the maximum extent practicable, and in a manner that does not appreciably reduce the likelihood of survival or recovery of the species in the wild.

Infectious Hematopoietic Necrosis Virus (IHNV) A viral pathogen present in nearly all populations of sockeye salmon, and some populations of steelhead trout and chinook salmon, that causes the potentially fatal disease Infectious Hematopoietic Necrosis.

Inner gorges

Deeply incised stream channels with steep side slopes, with high mass-wasting hazard (landslide potential).

Intakes

Structures through which water from the reservoir or river are taken into the City's hydroelectric generation and water supplies facilities; includes the penstocks and the Howell-Bunger valve.

Interior forest conditions

Forest conditions that are largely not affected by edge effects, which occur where large openings abut the forest. Edge effects that are know to occur in some areas include penetration of light and wind, temperature changes, and increased predator activity. Interior forest condition are achieved at sufficient distance from an edge so that edge effects are minimal.

Inundation

The condition whereby shorelines, streams, or vegetation are flooded by elevated water levels. When the inundating waters cover an area that had flowing water, such as the lower reach of a stream above a lake, inundation can result in increased sedimentation and decreased oxygen levels within the substrate.

Iteroparous

In general, applies to species in which individuals breed more than once in their lifetimes. Applies to salmonids that can survive initial spawning to spawn again in subsequent seasons. Resident trout and many individual anadromous steelhead trout are iteroparous, whereas salmon are semelparous (spawning only once).

Kelt

A maiden salmonid that survives its first spawning and returns to the sea.

Key habitat

Habitat that is utilized by and often required for a species for breeding or rearing or both.

Lake

A body of open water greater than 20 acres in area and at least 6.6 ft deep at low water.

Lake Washington

Basin

The entire area draining into Lake Washington. Also known as the Lake Washington Watershed.

Landsburg
Diversion Dam

Low dam at the site of the diversion for uptake of drinking water operated by Seattle Public Utilities, located at River Mile 21.8 of the Cedar River. As a run-of-the-river dam, it does not create a significant impoundment of water upstream. Also referred to as Landsburg Dam.

Landsburg
Drainage Subbasin

The 79,951 acres of land within the hydrographic basin of the Cedar River Watershed that drains into the Cedar River above the Landsburg Diversion Dam. The City owns all but 499 acres of this subbasin.

Landscape

A large regional unit of land that typically includes a mosaic of biological communities.

6-14 Glossary May 1999

Large woody debris (LWD)

Large pieces of wood in or partially in stream channels, including logs, pieces of logs, root wads of trees, and other large chunks of wood. LWD provides streambed and bank stability and habitat complexity. Often called coarse woody debris when within forests.

Late-successional forest

Forest in the later stages of forest succession, the sequential change in composition, abundance, and patterns of species that occurs as a forest matures. As used in the HCP, refers to conifer forests 120-189 years of age. Characterized by increasing biodiversity and forest structure, such as a number of canopy layers, large amounts of coarse woody debris, light gaps (canopy openings), and developed understory vegetation.

Lentic systems

Standing waters, such as lakes, ponds, and some wetlands.

Listed wildlife species, federal

Under the federal Endangered Species Act, species, or subunit of a species, formally listed in the Federal Register as endangered or threatened by the Secretary of the Interior or the Secretary of Commerce. A listing refers to the species or sub-unit by scientific and common name and specifies over what portion of its range it is endangered or threatened.

Listed wildlife species, state

Wildlife species that are classified as endangered, threatened, or sensitive under Washington State law. Defined in WAC 232-12-297.

Littoral zone

The shallow region of a lake or pond, to a depth of about 3 ft, which may have highly productive emergent macrophytes (large plants) that utilize the resources of both the terrestrial and aquatic habitats.

Live-box traps

A holding pen used in conjunction with fish traps; the trap captures the fish and the live-box holds them until removal.

Log

A down tree, or tree segment, lying on or near the ground. Logs provide valuable habitat for wildlife. Also, a segment of a harvested tree that may be suitable for lumber and other products.

Lotic systems

Flowing waters such as streams and rivers.

Long rotation

For this HCP, the relatively advanced age at which stands will be harvested in the commercial zone over the long term (120 years for Douglas-fir stands and 140 years for true fir stands). Typical rotation ages (ages at harvest) for private lands in the region vary from 40 to 60 years)

Lower Municipal Watershed

That area of the Cedar River Municipal Watershed generally west and south of Cedar Falls which largely drains to the mainstem of the Cedar River downstream of Masonry Dam.

Low-normal flows

The low part of the normal minimum instream flow curve, for flows in the Cedar River below the Landsburg Diversion Dam, during the period between October 8 and December 31 for some normal years. The applicability of this curve in any given year is based upon storage and hydrologic conditions prevailing each fall and is determined by specific flowswitching criteria and procedures. Low-normal flows are intended to provide more beneficial habitat conditions for anadromous fish in the fall than critical flows.

Mainstem

The primary stream channel of a river into which tributaries flow, extending from the mouth of the river to its furthest headwater.

Management prescriptions

A set of procedures designed to accomplish a specific management objective.

Marbled murrelet

Brachyramphus marmoratus. A Pacific seabird that typically nests in mature or old-growth forests within 50 miles of the marine environment; listed as a federal and state threatened species.

Mass wasting

Landslide; dislodgment and downslope transport of a single block of soil, rock, and vegetation resulting from the interaction of water and gravity on slopes. Occurs naturally in forested environments, but can be caused and made worse by disturbances such as poorly constructed forest roads.

Matrix

As used in the HCP, commercial harvest zone, or the area in which timber can be harvested for revenue.

Mature Forest

Forest that is entering later stages of forest succession. As used in the HCP, refers to conifer forests 80-119 years of age. While less so than late-successional forest, mature forest is characterized by increasing biodiversity and forest structure, such as a number of canopy layers, large amounts of coarse woody debris, light gaps (canopy openings), and developed understory vegetation.

Mid seral – closed canopy stage

Forest that is in the middle stage of a sere, or sequences of ecological communities in a forest succession. As used in the HCP, refs to conifer forest that is 30-79 years of age, in which the forest canopy is relatively closed, allowing little light penetration and understory development.

6-16 Glossary May 1999

Mitigation

Methods of reducing adverse impacts of a project by (1) limiting the degree or magnitude of the action and its implementation; (2) rectifying the impact by repairing, rehabilitating, or restoring the affected environment; (3) reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action; or, (4) compensating for the impact by replacing or providing substitute resources or environments.

Monitor species

Taxa of potential concern; a term frequently used to describe status, but not a legal designation; species native to the state of Washington that: (1) were at one time classified as endangered, threatened, or sensitive; (2) require habitat that has limited availability during some portion of its life cycle; (3) are indicators of environmental quality; (4) require further field investigations to determine population status; (5) have unresolved taxonomy which may bear upon their status classification; (6) may be competing with and impacting other species of concern; or (7) have significant popular appeal.

Monitoring

The process of collecting information to evaluate if objectives and anticipated results of a management plan are being realized or if implementation is proceeding as planned. This may include assessing the effects upon a species' habitat or non-organic components of the watershed, such as accretion flows.

Moraine

See "Glacial moraine."

National Environmental Policy Act (NEPA) A law passed in 1969 that requires all federal agencies to consider and analyze all significant environmental impacts of any action proposed by those agencies, to inform and involve the public in the agency's decision-making process, and to consider the environmental impacts in the agency's decision-making process.

National Marine Fisheries Service (NMFS) A branch of the National Oceanic and Atmospheric Administration, Department of Commerce, which is the listing authority for marine mammals and anadromous fish under the Endangered Species Act.

Native species

Any wildlife species naturally occurring in Washington for purposes of breeding, resting, or foraging, excluding introduced species not found historically in this state; defined by WAC 232-12-297.

Natural Heritage Program A Washington Department of Natural Resources program that identifies, selects, and nominates outstanding natural areas in Washington State; also, oversees state listing of plants.

New forestry

Timber harvest methods that are intended to sustain the ecological functions of the forest by carrying over key elements (biological legacies) of the previous forest, including live trees, snags, down wood, and other ecologically important elements of the mature forest; developed as an alternative to traditional industrial clearcut harvesting.

Non-firm block (of water)

As part of the instream flow regime, a specified volume of water (3,500 acre feet) that the City would provide, as a goal, between June 17 and August 4 in most normal years to supplement the required minimum instream flows in a manner that benefits anadromous fish.

Non-native species

Those animal and plant species that were not originally in a specific geographic area, but have been introduced, either intentionally or unintentionally, by humans.

Normal flows

The minimum instream flows (cfs) maintained in the Cedar River below the Landsburg Diversion Dam to provide beneficial habitat conditions for anadromous fish under other than conditions triggering critical flows. Normal instream flows which are provided, on average, nine-in-ten years, are higher for most periods of the year than critical flows. During the fall there are two normal flow regimes, high normal and low normal, which are provided under different hydrologic conditions.

Northern spotted owl

Strix occidentalis caurina. A medium-sized, dark brown owl native to the Pacific coastal region that primarily nests and lives in old-growth forest; federally listed as a threatened species and listed as endangered by Washington State.

Northern Spotted Owl Critical Habitat Unit (CHU) Area designated by the USFWS in 1991 (Fed. Reg. Vol. 57, Pp. 1796-1838) to protect remaining critical late-successional and old-growth forest habitat (and other areas) for the northern spotted owl and to reduce fragmentation. One of these units, WA-33, overlaps 22,845 acres of habitat in the eastern portion of the Cedar River Municipal Watershed and will be protected within the Ecological Reserve.

Northern spotted owl site center

The location of status 1, 2 or 3 northern spotted owls, based on the definitions from WAC 222-16-010 (see Appendix 24).

6-18 Glossary **May 1999**

Occupied marbled murrelet site

Areas used by marbled murrelets for nesting, as defined in

WAC 222-16-010 (see Appendix 24).

Old-growth conditions

Conditions in conifer forest stands, with vertical and horizontal structural attributes sufficient to maintain some or

all of the ecological functions of natural old-growth forest,

which is typically at least 200 years old.

Old-growth forest As used in the HCP, native, unharvested conifer forest in the

Cedar River Municipal Watershed that is at least 190 years of

age.

Open water bodies All lakes and ponds of any size without forest canopy above.

Out-migrant A juvenile fish that is migrating from one rearing

environment to another.

Overlay analysis The process of stacking digital representations of various

spatial data on top of each other so that each position in the area covered can be analyzed and evaluated in terms of these

combined data.

Palustrine emergent wetlands

Palustrine wetlands characterized by erect, rooted, herbaceous hydrophytes (plants adapted to water or waterlogged soils), excluding mosses and lichens, which are present for most of the growing season in most years. Includes wetlands often

referred to as marshes and wet meadows.

Palustrine forested

wetlands

Palustrine wetlands characterized by woody vegetation that is

20 ft tall or taller (trees).

Palustrine scrubshrub wetlands Palustrine wetlands dominated by woody vegetation less than

20 ft tall (shrubs and shrubby trees).

Palustrine wetlands Freshwater (non-marine) wetlands dominated by trees,

shrubs, persistent emergents, or emergent mosses or lichens, and wetlands lacking vegetation that have an area of less than 20 acres and are no deeper than 6 ft; palustrine wetlands

include marshes, swamps, bogs, and fens.

Parr A juvenile salmonid rearing in fresh water at the stage at

which it has developed parr marks before it reaches the smolt

or sub-adult stage.

Parr marks The vertical markings on a juvenile salmonid.

Pelagic zone The open, mid-column zone in a body of water that is not

associated with shoreline or shallow depths.

Penstocks Large pipes that carry water from Masonry Dam to the Cedar

Falls Powerhouse, for operation of hydroelectric turbines.

Persistent emergent vegetation

Erect, rooted, herbaceous vascular plants that may be temporarily to permanently flooded at the base but do not tolerate prolonged inundation of the entire plant, and that normally remain standing at least until the beginning of the next growing season.

Pole

A young tree, from the time its lower branches begin to die until the time the rate of crown growth begins to slow and crown expansion is noticeable. For the classification system used in the HCP, includes trees from 5.01 to 11.0 inches dbh.

Polygon

A GIS term for a multi-sided figure that has area and which represents a habitat unit, man-made structure, or other spatial entity on a map.

Pond

A body of open water from 0.5 to 20 acres in area and at least 6.6 ft deep at low water.

Precommercial thinning

A silvicultural treatment applied on Matrix lands (those available for commercial timber harvest) that involves cutting, girdling, or otherwise killing excess trees from young (usually 10 to 30 year-old), overstocked stands to reduce competition and encourage better growth. This silvicultural practice also accelerates the development of mature stand characteristics, reduces the amount of time a stand remains in the stem exclusion stage (a stage characterized by minimal light penetration and low biological diversity), protects water quality by reducing the risk of large scale catastrophic damage to the watershed (primarily through development of windfirmness and increased resistance to insect attack), and improves overall health and vigor of the leave trees. Precommercial thinning is used to produce, over time, an increase in the stand's usable volume in preparation for commercial harvest. See Figure G-1.c for illustration.

Probable maximum flood (PMF)

A flood that may be expected from the most severe combination of critical meteorological and hydrologic conditions that are reasonably possible in the drainage basin under study.

Profundal zone

The deeper sediment bottoms of a body of water which is free of vegetation.

Proposed threatened or endangered species, federal Species formally proposed in the Federal Register by the Secretary of Interior or the Secretary of Commerce for listing as threatened or endangered under the federal Endangered Species Act; not a final designation.

6-20 Glossary **May 1999**

Puncheon, wood A drainage structure constructed of wood, usually logs,

placed beneath the surface of a road in two or more layers (first perpendicular to the road, then longitudinally) to facilitate the passage of water under the road, while

supporting the road and traffic.

Rain-on-snow zone The area where several times during the winter the snowpack

is partially or completely melted during warm periods and/or

rainstorms.

Rattlesnake Lake Viewshed Rattlesnake Lake and the land immediately surrounding, including Rattlesnake Ledge, that has been set aside for

public usage.

Reach See "Stream reach."

Rearing habitat Areas in rivers, streams, ponds, or lakes, where juvenile

salmon and trout find food and shelter to live and grow.

Redd A salmonid fish's nest, which is created by excavating a

shallow pit in gravel where eggs are buried for incubation.

Regeneration harvest

A general term for silvicultural systems that involve removal of most trees within a harvest area for the purpose of stand regeneration. (Regeneration harvest systems return the stand to an early stage of forest succession.) Such systems are commonly used for commercial timber harvest in the Pacific Northwest and include clearcutting, shelterwood harvest, seed

tree harvest, and retention harvest (see definition).

Remote sensing Information acquired by indirect means, such as by satellite or

airplane.

Reservoir As used in the HCP, the Chester Morse Lake/Masonry Pool

complex; also referred to as the reservoir complex.

Restoration planting Planting of native trees, shrubs, and other plants to encourage

development of habitat structure and heterogeneity, to improve habitat conditions for fish and wildlife, and to accelerate development of old-growth conditions or riparian

forest function in previously harvested second growth.

Restoration thinning

As used in this HCP, a silvicultural intervention strategy applied in the Ecological Reserve in areas of young (usually 10 to 30 year-old) over-stocked forest with the intent of increasing biological diversity and wildlife habitat potential, accelerating the development of mature forest characteristics, and minimizing the amount of time a stand remains in the stem exclusion stage (a stage characterized by minimal light

Restoration thinning (continued)

penetration and low biological diversity). This strategy protects water quality by reducing the risk of large scale catastrophic damage to the watershed (primarily through development of windfirmness and increased resistance to insect attack, which is exacerbated by the stress on intense competition among trees). Techniques for restoration thinning include cutting, girdling, or otherwise killing some trees in variable density thinning patterns, retaining a mix of species that is characteristic of natural site conditions, and leaving small gaps or openings characteristic of naturally regenerated forests that result from small natural disturbances such as wind or disease. See Figure G-1.d for illustration.

Retention harvest

As used in this HCP, a type of regeneration harvest applied on Matrix lands (those available for commercial harvest). Compared to traditional clearcutting, retention harvest entails retaining more trees per acre than required by Washington State Forest Practice Rules. As applied in the HCP, the intent of this method is to achieve an average 20% volume retention goal that includes retaining biological legacies such as remnant older trees, other green trees, previously unmapped forested wetlands, and inoperable patches of forest. Retention harvest also focuses on protection of other biological legacies, such as shrubs, snags, logs, understory vegetation, and soil microorganisms. This harvest is intended to provide revenue while promoting structural and biological diversity characteristic of naturally regenerated stands. Trees may be retained in either dispersed or clumped patterns. See Figure G-1 e for illustrations

Revised Code of Washington (RCW) A revised, consolidated, and codified form and arrangement of all the laws of the state that are of a general and permanent nature.

Riparian habitat

Habitat along lakes, rivers, and streams where the vegetation and microclimate are influenced by year-round or seasonal water and associated high water tables.

Riparian zone

A zone adjacent to lakes, ponds, rivers, and streams where the microclimate, soil, and vegetation are typically, although not always, influenced by surface water and associated groundwater; this area forms an interface between the aquatic environments and adjacent terrestrial habitats and includes riparian habitat. Wetlands may or may not be located within this zone, and vegetation in a riparian zone may or may not include true riparian habitat.

6-22 Glossary **May 1999**

River mile (RM) Statue mile as measured along the center line of a river.

River miles (RM) are measured upstream from the mouth of a river (e.g., RM 18.5), but can also used as a discrete measure

of distance in a river or stream (e.g., 1-3 river miles).

Rotation The number of years required to grow a stand to a desired size

or maturity before harvest. Rotation age is the typical age of a stand at harvest in a particular harvest management regime.

Salmonids Fish species belonging to the family Salmonidae, including

trout, salmon, char, and whitefish species.

Sapling A young tree which is no longer a seedling but not yet a pole.

As used in the HCP, trees from 2.01 to 5.0 inches dbh.

Scour The erosion of stream bed and/or banks caused by flood water

in a river or stream.

Screw traps A mechanism for trapping juvenile fish, usually downstream

migrants, by which the fish are pulled into a live box by a large screw mechanism that turns by the force of the water.

Second-growth Forest stands in the process of regrowth after an earlier

cutting or disturbance.

Semelparous In general, applies to species in which individuals breed only

once in their lifetimes. Applies to salmonids that die after spawning, such as do all of the Pacific salmon species.

Sensitive soil Soils with moderate or high flood hazard potential, or slow or

very slow drainage rates, or that are formed in place

(organics), or that are alluvial soils.

Sensitive species,

state

A wildlife species native to the state of Washington that is vulnerable or declining and is likely to become endangered or threatened in a significant portion of its range within the state without cooperative management or the removal of threats. Sensitive species are legally designated in WAC 232-12-011

and defined in WAC 232-12-297 Section 2.6.

Seral stage A particular stage (ecological community) in a sere, or pattern

of succession. As used in the HCP, applies to forest

succession

Sidecast Excavated material that has been moved to the side and

deposited within the limits of construction for a road or

landing (for collecting lags during timber harvest), or that has been dumped over the side and outside the limits of

construction. Sidecasting results in over-steepened slopes that, in very steep terrain, can cause slope instability and

failure under certain conditions.

Silviculture The theory and practice of controlling the establishment,

> composition, growth, and quality of forest stands in order to achieve management objectives. Includes such actions as thinning, planting, fertilizing, pruning, and leaving seed trees

at harvest.

management area

(SMA)

state

Smolt The life stage of a juvenile salmon when it migrates to

saltwater, involving physiological changes that adapt an individual for the change from fresh to salt water.

Snag A standing dead tree.

Special Areas outside the Ecological Reserve within which timber

> harvest and other activities will be constrained, largely so as not to encourage buildup of mammal populations that may carry pathogens potentially injurious to humans. Applied to areas with potentially the greatest chance to influence water at

the Landsburg intake.

Species A unit of the biological classification system (taxonomic

system) below the level of genus; a group of individual plants or animals (including subspecies and populations) that have common attributes and are capable of interbreeding The federal Endangered Species Act defines species to include subspecies and any distinct population segment of any species

that interbreeds when mature.

As used in the HCP, any species addressed by the HCP and Species of concern

whose conservation strategies are taken into account by the

HCP.

Species of concern, An unofficial status designation given a species which

appears to be in jeopardy, but for which insufficient federal

information exists to support listing.

Species of concern, Those species listed as state endangered, state threatened, state sensitive, or state candidate, as well as species listed or

proposed for listing by the Secretary of Interior or Secretary

of Commerce.

6-24 Glossary May 1999 Species of greatest As used in the HCP, 14 species addressed by the HCP that are

currently listed under the Endangered Species Act or concern

otherwise are believed to be at significant risk in the region.

Stand (forest stand) A group of trees that possess sufficient uniformity in

composition, structure, age, spatial arrangement, or condition

to distinguish them from adjacent groups of trees.

Stand regenerating

harvest State

See "Regeneration harvest."

Environmental

Policy Act (SEPA)

The state law that requires all state and local government agencies to consider and analyze the adverse environmental impacts of any action proposed by those agencies, to inform and involve the public in the agency's decision-making process, and to consider the environmental impacts in the agency's decision-making process.

Stem or Competitive Exclusion

The competitive exclusion stage is described as the phase of forest development when trees fully occupy the site and compete with one another and other plants for light, water, nutrients, and space to the point where most other vegetation

and many trees become oppressed and die.

Stock The group of fish spawning in particular lake(s) or stream(s)

at a particular season that to a substantial degree do not interbreed with any group spawning in a different place, or in

the same place at a different season.

Stream reach A segment of a stream that has beginning and end points

selected for some specific characteristic.

Succession A natural replacement of one plant (and/or animal)

community by another over time in the absence of

disturbance

Suitable marbled

murrelet habitat

A contiguous forested area containing trees capable of providing nesting opportunities, as defined by WAC 222-16-

010 (Appendix 24).

Suitable spotted

owl habitat

Forest stands that meet descriptions defined in WAC 222-16-

085 (Appendix 24).

Tailrace A structure and outlet that conveys flow from a hydroelectric

turbine to the river.

Tailrace rack

(barrier)

A barrier that keeps fish from swimming upstream into a

hydroelectric turbine.

Glossary 6-25 **EA/Final EIS**

Tainter gates A type of gate with a circular segment for its face, rotating

about its center of curvature; commonly used on dams and diversion structures to control the flow of water over and

under a spillway.

Take To harass, harm, pursue, hunt, wound, kill, trap, capture, or

collect a federally listed threatened or endangered species, or to attempt to do so (ESA, Section 3[10]). Take is prohibited under federal law, except where authorized. Take may include disturbance of the listed species, nest, or habitat when disturbance is extensive enough to disturb negative enough to disturb negat

disturbance is extensive enough to disrupt normal behavioral patterns for the species, although the affected individuals may not actually die. See also "Harm" and "Incidental take."

Talus An accumulation of rock debris at the base of a cliff or rock

formation, typically forming a slope that is often unstable.

Threatened species, A designation as defined in the federal Endangered Species federal Act for a species that is likely to become endangered

Act for a species that is likely to become endangered throughout all or a significant portion of its range within the

foreseeable future.

Threatened species, A wildlife species native to the state of Washington that is state likely to become endangered within the foreseeable future

likely to become endangered within the foreseeable future throughout significant portions of its range within the state without cooperative management or the removal of threats. Threatened species are legally designated in WAC 232-12-

011and defined in WAC 232-12-297 Section 2.5.

Tribe, the The Muckleshoot Indian Tribe.

Tributary A stream that flows into a larger stream or body of water.

Turbidity A measure of the relative clarity of water, which may be

affected by material in suspension in the water.

Turbine The machine used to convert the energy of water into

electrical energy.

Type I-III waters In the context of the HCP, fish bearing waters. Definition

based on WAC 222-16-030.

Type IV waters Streams without fish that influence Type I-III waters under

the state classification system; streams with a well-defined channel, which may be perennial or intermittent. Definition

based on WAC 222-16-030.

6-26 Glossary **May 1999**

Type V waters Streams without fish that influence Type IV waters under the

> state classification system; includes streams with or without well-defined channels. Definition based on WAC 222-16-

030.

Type IX waters A stream, or potential stream, which has not yet been typed

under the state classification system.

U.S. Fish and Wildlife Service (USFWS)

The federal agency that is the listing authority under the Endangered Species Act for plant and animal species other

than marine mammals and anadromous fish.

Upper Municipal Watershed

That area of the Cedar River Municipal Watershed generally east of Cedar Falls which drains to the Chester Morse Lake

Basin

Up-ramping Increases in instream flows as a result of changes in facility

operations, most often expressed as a rate of increase in water

elevation in inches per hour.

USGS gage A streamflow discharge measuring station; records stage, or

height, of water, which can then be converted to discharge

(cfs) based on stream geometry.

Walsh Lake **Diversion Ditch** An approximately 4 mile-long channel constructed in the early 1930s to redirect the drainage waters from Walsh Lake (within the Cedar River Municipal Watershed) to a point in the Cedar River downstream of the Landsburg Diversion Dam and drinking water intake structures. Also referred to as

Walsh Lake Ditch or Walsh Ditch.

Washington Administrative Code (WAC)

All current, permanent rules of each state agency, adopted

pursuant to chapter 34.05 RCW.

Watershed

A basin contributing water, organic matter, dissolved nutrients, and sediments to a stream, lake, or ocean. As applied in the HCP, used also to refer to the Cedar River Municipal Watershed above the Landsburg Diversion Dam and water intake, some of which does not drain into the Cedar

River above the Landsburg water intake.

Watershed analysis

A cumulative effects assessment prepared for forest practices in a watershed administrative unit under the Washington State Forest Practices Act with the long-term objective of protecting and restoring public resources and the productive capacity of fish habitat affected by forest management operations; produces prescriptions for future management; completed under WAC 222-22-050 or WAC 222-20-060, with prescriptions selected under WAC 222-22-010.

See "Fish weir" Weir

Forest - Mixed

Forest - Pure

Western 50 to 70 percent crown closure in western hemlock or western

Hemlock/Western redcedar; other species present either coniferous or

Redcedar deciduous.

Western More than 75 percent crown closure in western hemlock or Hemlock/Western western redcedar; other species present either coniferous or Redcedar deciduous

Wetland Land where the water table is usually at or near the surface or

> the land is covered by shallow water and has one or more of the following attributes: the land supports, at least

periodically, predominantly hydrophytic plants (plants adapted to water or waterlogged soil); substrate is

predominantly undrained hydric soils; and/or the substrate is nonsoil and is saturated with water or covered by shallow water at some time during the growing season each year.

Wild stocks In Washington State, a fish stock that is sustained by natural

spawning and rearing in the natural habitat, regardless of

parentage; can include native or introduced stocks.

Wildlife reserve Defective, dead, damaged, or dying tree which provides tree

habitat for wildlife species dependent on standing trees;

defined in WAC 222-16-010.

Yarding The transport of logs from the point of felling to a collecting

point or landing.
